

Practicing for IMY 310 Semester Test 2

Combining the similar questions from 2023 and 2022

1. Discuss how you will go about collecting data for your chosen topic.
2. Identify potential user groups for the chosen topic. For each user group identified, motivate why this type of user would be concerned with the chosen topic.
3. Clearly state one data collection technique that you would use for this topic. Discuss what details you intend to extract for the data you have collected (slides 13 - 30). Depending on your data collection technique you should discuss:
 - The kind of data (e.g. demographics, performance, feedback, train of thoughts)
 - User abilities/disabilities, knowledge/lack thereof
 - User behaviour, habits, expectationsType of questions you intend to ask or comments you will be looking out for
 - How the session will be setup or how the data collection will be distributed
4. Based on the data collection technique chosen previously, identify what types of data will result from this data collection technique. Provide a motivation for each type of data identified.
5. Discuss what analysis approach you would use for the resulting data. Provide a detailed discussion to motivate your answer.
Keep in mind of the following:
 - Qualitative - Looking for critical incidents, identifying recurring themes, categorising data
 - Quantitative - Statistical data, majority/minority, average
6. Discuss which type of setting (controlled, natural, not involving users) the chosen topic should be conducted in (slides 06 - 17). Motivate your answer by discussing why this setting would be the most appropriate choice. Also discuss potential issues that may occur with the chosen setting and how these issues can be minimised. [Hint: data collection techniques used can help with minimising disadvantages]
7. Based on a crucial feature in your app, discuss how a dark pattern can be created.

8. Additional context for the topic: assume that the University of Pretoria recently built living labs (textbook pages 503-504, 515) and have made them accessible for research to be conducted in them.

You decide to use the living labs as the setting for testing your app.

Discuss the following:

- the type of research setting this would be considered as
- the reasoning for your answer
- the benefits of using a living lab

9. Discuss how a predictive model, specifically Fitts' Law (slides 22–23), can be used to provide informative design decisions for the app of your chosen topic.

Your discussion should address the following points:

- Context: using Fitts' Law to predict user behavior when interacting with the app
- The design decisions: using Fitts' Law to inform design decisions regarding various attributes of UI elements
- Predicted support: the resulting user behavior that can provide a positive user experience by supporting the users' interactions with the app
